TECHNICAL MEMORANDUM

TO:

25X1

FROM:

SUBJECT: Image Analysis - Data

REFERENCE: 2300301-TM-69-1

25X1

As we discussed, I can find nothing really wrong with the data produced, but I can also find no real evidence of any investigative thought. In other words, there has been no imagination used.

My conclusion from reading the report and looking at the figures is that W.W.M. is performing most of the work single handed. The inevitable result is slow delivery and underexpending. There is no evidence that any of the suggestions made by either of us have been followed so far. In particular, it was suggested that special emphasis be put on avoiding the human factors problem, that they analyze the 50% transmittance point, that they look at other density differences, etc. You also asked that an estimate be made of the point at which circles and triangles become indistinguishable.

The results presented are good, from a technician point of view, but are not what I would call much of an investigation. Perhaps the extension can improve the analysis of available data, but I suggest the work statement be fairly specific.
